

The Man Who Wont Roll: A Case Study

Frances Arnold – Occupational Therapist

Yooralla Lifestyle Support and Choice

frances.arnold@yooralla.com.au

Person

- 49 year old man >130kg
- Great sense of humour
- Enjoys spending time with friends, writing poetry, drawing and painting in powered wheelchair
- PMHx C4-5-6 complete spinal cord injury, ABI, Depression
- Chronic pressure sores often led to depressive episodes

Environment

- Lives in shared supported accommodation
- Staff reporting low confidence in assisting Gavin to move in bed
- Multiple Work Cover claims
- All of original payout spent
- Department of Human Services (DHS) concerned about spiralling cost of care

* The environment was not supporting Gavin to be happy and feel safe in his routine

- Wound care and bowel care completed every second day
- Fearful of returning to hospital
- Found morning routine stressful
- Depression often brought about by pressure injuries
- When depressed spent all day in bed

Occupation

Gavin has given permission for his name and images to be used. He will be co-presenting during the allocated poster time

Equipment trialled

All-ways slide: Not appropriate as it required too much strength from staff when lifting Gavin into rolled position.

Rolling Sling: Too small to rotate Gavin as his area of weight distribution was larger than the sling.

SmartTech Turning bed: Purchased at a cost of \$13,000 as it was the best option at that time. Did not effectively redistribute pressure and still required three staff to keep Gavin on his side for care in bed. Gavin found it uncomfortable.

Before Vendlet

- Staffing: Morning routine required 3x Disability Support Workers and one nurse
- Time taken was up to 2 hours
- Gavin's perspective: he did not like 8 hands supporting his side, lack of privacy, frustrated waiting for staff, fixated on routine
- Staff perspective: fearful of injury, reported it was the hardest part of the shift, time consuming, strained relationship with Gavin

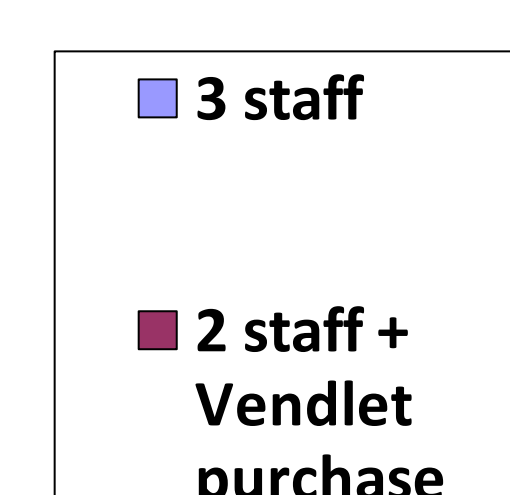

After Vendlet

- Staffing: Morning routine requires one or two Disability Support Workers and one nurse
- Time taken: Less than one hour
- Gavin's perspective: smooth rolling and positioning, increased privacy and dignity, increased choice and control over routine, increased quality of life, decreased negative self-talk
- Staff perspective: simple morning routine, enhanced interactions with Gavin

Initial cost of Vendlet system — \$11,000

Total cost over time

Summary

Cost benefit: broke even at five weeks

Collaboration: outcome not possible without the person, support staff, therapists, service manager and DHS focused on same goal

Perseverance: Four years of therapy review to reach this outcome

The future: With NDIS on the horizon, people will have control over their money and more holistic purchases of assistive technology will be possible

COST BENEFIT ANALYSIS: Clinical decision making around high cost assistive technology must consider the impact on other expenses, and not just the initial purchase
